CAPTURE. SHARE. TRAIN.

XCapture™ experience sharing applications are web-based tools that help users capture mission and event experiences and lessons learned in a form that is easy to document, share, and apply.

Based on a highly adaptable platform, XCapture applications rapidly walk a user through a guided interview to capture the critical information from a military mission, emergency event, or disaster response.

XCapture applications let you:

➤ Rapidly and easily create, edit, and view descriptions of missions, events, and lessons learned
➤ Easily create a variety of reports using standard templates or ones you design yourself
➤ Share the information you develop with others in your professional community

XCapture applications can integrate with AlphaTRAC's crisis decision training technologies to provide the foundation for scenario-based online training.

Current Features

XCapture applications:

➤ Have an easy-to-use interface similar to many tax preparation applications
➤ Structure mission/event and lessons learned information and store it in a secure database
➤ Include a search function you can use to locate information of interest
➤ Let you share your information with others in the XCapture community and view the information that others share with you
➤ Present lessons learned in context of the mission/event
➤ Provide customizable, printable worksheets and reports
➤ Provide an online forum to support knowledge sharing and discussions among users

XCapture Applications

The XCapture suite of applications is based on a common technology platform. Each is tailored to the needs of a specific user community—all of which share in advances made to the base technology.
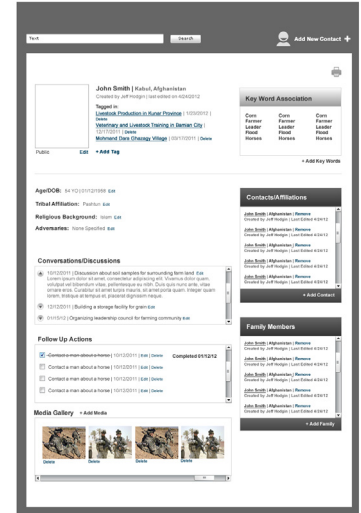

XCapture ADT

XCapture ADT helps National Guard Agribusiness Development Teams (ADTs) quickly and easily gather and organize mission information, conduct after action reviews (AARs), prepare mission reports, and share knowledge with other teams in-theater and at home.

With XCapture ADT, you can create, edit, and review a variety of standard mission reports, including AARs, mission summaries, and StoryBoards.

Using the guided interview, the system helps you document:

➤ Pre-mission information, including the mission purpose and schedule; assumptions about the weather, terrain, and driving conditions; planned tasks; civil considerations; and an assessment of risk

➤ Mission information, including the tasks that were actually attempted or completed and a review of the mission as a whole

➤ Lessons learned, including a review of the actual risk and suggestions for things to sustain and improve

XCapture ADT is currently deployed with provincial reconstruction teams in Afghanistan as part of a pilot program.

XCapture Fire

Currently under development, XCapture FIRE will help firefighters quickly and easily prepare post-incident reports for formal and informal experience sharing. The reports will be made available to the XCapture fire community through a searchable database which will let users locate incidents of interest. Shared experiences will also be used in AlphaACT® FIRE, as part of the experience database used in crisis decision training.

Using the guided interview, the system will help you document:

➤ Background information about the event and the resources available to deal with it

➤ Information about the event and the event scene

➤ A post-incident review, including lessons learned

XCapture FIRE is planned for a summer 2013 launch.

XCapture HAZMAT

Also under development, XCapture HAZMAT will help emergency responders quickly and easily gather and record event information for a broad range of hazardous material events. HAZMAT responders will use the tool's guided interview to quickly develop post-incident reports which will be made available to the XCapture response community via a searchable database. Shared experiences will also be used in AlphaACT HAZMAT, as part of the experience database used in crisis decision training.

XCapture HAZMAT is planned for a summer 2013 launch.

Future Features

Other efforts are on the drawing board or already under development. Future features planned for XCapture applications will let you:

➤ Gather field information, including notes, audio, photographs, video, and maps using apps on mobile devices

➤ Facilitate a team AAR process that includes AAR meeting agendas, reporting templates, and the tools to conduct virtual team meetings for distributed team members

➤ Easily export formatted information and data to lessons learned and other external databases
